

How does it work?

Step 1: mixtures

Two mixtures must be made before applying

1. Mixture of medium (product A) + acrylics. The medium thins the acrylic and gives it a satin appearance. It creates a cleaner and smoother pour
2. Catalyst mixture (product B) + acrylic. The catalyst reacts on contact with the medium, creating the cells and lace effect. Its properties also lock the effects during the drying phase

Step 2: application

1. Colours pouring mixed with medium + acrylic onto a rigid painting surface
2. Application with a painting knife of the catalyst + acrylic mixture on top of the previously poured colors.
3. Repeat the process until you get the desired result
